

Eliminate Shadow IT with Morpheus

Let's face it, IT and Dev have plenty on their plates. While there may be an expected disagreement here or there, both groups do their best to work together for a common goal: to help their company grow and increase revenue. When departments in your organization go rogue it makes it harder for everyone to do their jobs. Morpheus makes sure you have all the control and visibility you need to keep up with the speed of business, and be an effective IT leader.

Stop An Abusive Shadow IT Cycle

Stop reacting and start acting. Does this cycle sound familiar?

1. Business is booming and Dev requires more resources
2. IT is working to comply (and to fulfill requests from just about every department in the company), but OEMs are slow to deliver legacy hardware. Business requires fast action so app dev goes to the cloud.
3. IT struggles to maintain control and visibility to cloud resources, to control costs, to manage compliance, and a slew of other things.

4. Business is still booming and hasn't waited for you to catch up. More requests pile in.
5. Repeat.

See the vicious cycle? Morpheus makes it faster and easier to track all the moving parts and provide Dev with all the tools they need to focus on building.

Unparalleled Visibility & Control

Morpheus' one-click provisioning and self-service portal delivers IT with unparalleled control and visibility, all while keeping Dev happy. IT enjoys complete visibility and control across all

computing environments, while Dev enjoys choice and control with easy access to a catalog of approved apps, databases, and computing clouds. You can also set up and enforce policies and user rights with ease so compliance headaches become a thing of the past. Transform your Shadow IT from a liability to first-class deployments that can be pre-approved, backed up, scaled up, audited, and even migrated.

Manage Every Deployment, Instance, & App — In One place

Imagine having one source of truth. Morpheus lets you see every thing you need to manage —every app, database, server, environment, instance, etc.— in one place. No more gathering info from dozens of people and sources. Rogue environments are almost inevitable in today's fast-moving workplace. Morpheus makes rogue environments and shadow IT less of a headache and lets you spend less time tracking down rogue IT and more time contributing to the bottom line. You can thank us later.

Better Compliance

Just say when, where, and how. Morpheus enables you to set up and enforce specific policies across any on-premise servers or clouds (private, public, or hybrid). You maintain control by specifying the servers and locations of each database and application. Deliver choice with control to your users and become the IT hero.

The screenshot shows the Morpheus Admin interface. The top navigation bar includes Dashboard, Apps, Provisioning, Backups, Logs, Monitoring, Reports, and Admin (highlighted). Below this is a sub-navigation bar with Groups, Servers, Accounts, Containers, Service Plans, Roles, Users, and Settings. The main content area is titled 'MBP 15' and shows a table of 'ACTIVE CLOUDS' with columns for TYPE, NAME, SERVERS, and LOCATION. Below the table are two columns of cloud providers: PUBLIC CLOUD (Microsoft Azure, DigitalOcean, Google Cloud Platform Live, SOFTLAYER, vCloud Air, amazon web services) and PRIVATE CLOUD (SELF-MANAGED, vmware, openstack, metacloud). Each provider has a '+ ADD' button next to it.

TYPE	NAME	SERVERS	LOCATION
Self Managed	Vagrant	1	

PUBLIC CLOUD

- Microsoft Azure (+ ADD)
- DigitalOcean (+ ADD)
- Google Cloud Platform Live (+ ADD)
- SOFTLAYER (+ ADD)
- vCloud Air (+ ADD)
- amazon web services (+ ADD)

PRIVATE CLOUD

- SELF-MANAGED (+ ADD)
- vmware (+ ADD)
- openstack (+ ADD)
- metacloud (+ ADD)
