

DevOps for Service Providers

Amazon continues to dominate the cloud computing market and IaaS and Co-location services are becoming commoditized. Service Providers are struggling with differentiating their offerings and providing higher margin value-added services

Morpheus gives service providers a multi-tenant hybrid cloud platform allowing operators and end users to instantiate new databases and applications (AppStacks) with one click. Users have the option of a managed or self-service experience; enabling customers to consume compute resources on demand.

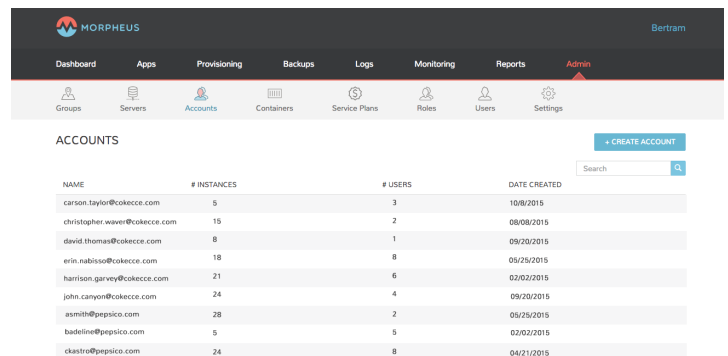

Morpheus provides a single pane of glass for high margin managed services such as DBaaS, DRaaS, monitoring and logging. A user-friendly UI means operators don't need a more than a day to master the basic functionality of Morpheus.

Morpheus is the ultimate turnkey DevOps tools for service providers. Since Morpheus was created independent of other software, it's not an add-on or part of larger, more expensive "ecosystem." Quite simply, Morpheus means DevOps in a box.

Morpheus can easily orchestrate compute resources between public, private, and hybrid cloud environments. Operators glean insight into competitive offerings and utilization and create new revenue streams by imposing a fee to orchestrate servers whether they're on-premise or in any private or public cloud.

By linking together multi-tiered applications and databases, Morpheus abstracts the code from the infrastructure, enabling AppStacks and workloads to become portable. With Morpheus cloud migration isn't a hassle, it's built right in.
